Working title for your project idea - Personalized denim fitting experience

What problem would this solve?

Customers shopping for women's denim face a highly fragmented and often frustrating experience driven by the complexity of fit (rise, stretch, cut, length, wash). This leads to:

High cognitive load during purchase decisions

Multiple size/style purchases to "try at home"

Elevated return rates due to poor fit confidence

Lost conversions when customers abandon the journey altogether

Even in-store, the experience can feel self-guided and inconsistent, lacking the expertise and personalization needed to confidently land on the "right" pair.

For high-value loyalty customers, this gap is even more pronounced — expectations for premium, personalized experiences are not consistently met in one of our most important wardrobe categories - Women's denim.

What is the value that solving that problem brings?

Solving this in a tech-enabled way unlocks value across customer experience, revenue, and operations:

Customer Value

Reduces friction and overwhelm in a high-stakes purchase category

Builds confidence in fit through expert, personalized guidance

Delivers a premium, high-touch experience aligned with loyalty expectations

Business Value

Increased conversion rates from high-intent customers (appointment-based shopping)

Higher AOV driven by stylist-led outfitting (denim + tops)

Reduced return rates due to better first-time fit accuracy

Strengthened loyalty engagement and brand affinity

Strategic Value

Establishes a scalable foundation for service-based retail experiences

Creates a bridge between digital intent (app booking) and in-store conversion

Opens future pathways for personalization (fit profiles, recommendations, etc.)

What is the most important piece of functionality that would need to be completed for this to accomplish the goal of proving out this idea (Minimum Viable Product)?

The MVP should focus on proving one core hypothesis:

Customers will book and attend a personalized denim fitting experience when offered through the app.

To validate this, the most critical functionality is:

A simple, app-based appointment booking experience for a denim fitting session at a flagship store

Key components:

Clear value proposition and positioning within the app (loyalty-exclusive experience)

Ability to select store, date, and time

Basic confirmation and reminder flow

Lightweight internal notification to store staff to prepare for the appointment

This intentionally avoids complexity (e.g., quizzes, inventory integration) and relies on a human-led in-store experience to deliver value.

Success is measured by:

Appointment booking rate

Appointment attendance rate (secondary)

Is there any proprietary data or knowledge that would be required?

No

Are you able to provide sample data?

No

Is there any formal documentation that you could provide which further defines the idea?

Yes

General approach to consider

*iOS App channel focus to start

Phase 1: Lean Pilot (Flagship Store)

Launch in a single flagship location with trained stylists

Introduce the experience to a targeted group of loyalty customers via app placement (and potentially email support)

Keep the digital experience intentionally simple — focus on clarity of value and ease of booking

In-Store Execution

Deliver a high-touch, stylist-led fitting focused on denim, with natural upsell into outfitting

Ensure consistency in experience through light guidelines or playbooks for associates

Measurement & Learning

Track booking conversion and attendance

Gather qualitative feedback from both customers and store associates

Observe operational realities (time per session, staffing needs, no-shows, etc.)

Phase 2 Considerations (Post-Validation)

Introduce pre-appointment preference capture (fit, style, size)

Enable inventory-aware preparation for sessions

Expand to additional stores and broader customer segments

Build persistent “fit profiles” to connect in-store learnings back to digital experiences

Any processes, platforms, languages, frameworks, or methodologies that should be considered?

iOS App platform.
